1. Write a python program which defines a function to find maximum of 3 numbers. Read the numbers as input and pass as argument to the function.

```
def find_max(a, b, c):
    return max(a, b, c)

num1 = float(input("Enter first number: "))
num2 = float(input("Enter second number: "))
num3 = float(input("Enter third number: "))

maximum = find_max(num1, num2, num3)
print(f"The maximum of {num1}, {num2}, and {num3} is {maximum}")
```

```
PS C:\Users\surya.p\Desktop\PythonTask> & "C:/P
Enter first number: 13
Enter second number: -1
Enter third number: 5
The maximum of 13.0, -1.0, and 5.0 is 13.0
PS C:\Users\surya.p\Desktop\PythonTask>
```

2.Write a python program to read string as input and check whether it is a palindrome.

```
def is_palindrome(s):
    s = s.replace(" ", "").lower()
    return s == s[::-1]

string = input("Enter a string: ")

if is_palindrome(string):
    print(f'"{string}" is a palindrome.')
else:
    print(f'"{string}" is not a palindrome.')
```

```
PS C:\Users\surya.p\Desktop\PythonTa
Enter a string: madam
"madam" is a palindrome.
PS C:\Users\surya.p\Desktop\PythonTa
Enter a string: sura
"sura" is not a palindrome.
```

3.Write a Java program which performs file copy.

```
import java.io.FileInputStream;
import java.io.FileOutputStream;
import java.io.IOException;
public class program9 {
  public static void main(String[] args) {
     String sourceFile = "C:\\Users\\surya.p\\Desktop\\PythonTask\\source.txt";
     String destFile = "C:\\Users\\surya.p\\Desktop\\PythonTask\\destination.txt";
     try (
        FileInputStream fin = new FileInputStream(sourceFile);
        FileOutputStream fout = new FileOutputStream(destFile);
     ) {
        int byteData;
        while ((byteData = fin.read()) != -1) {
           fout.write(byteData);
        }
        System.out.println("File copied successfully.");
     } catch (IOException e) {
        System.out.println("An error occurred: " + e.getMessage());
     }
  }
}
```

```
File copied successfully.
```

4.Write a python program to find the number of lines, words and characters in a file.

```
def file_statistics(filename):
    lines = 0
    words = 0
    characters = 0

    with open(filename, 'r') as file:
        for line in file:
            lines += 1
            words += len(line.split())
            characters += len(line)

    return lines, words, characters

filename = input("Enter the filename: ")
```

Surya Prakash M
24/7/2025

```python
try:
    lines, words, characters = file_statistics(filename)
    print(f"Lines: {lines}")
    print(f"Words: {words}")
    print(f"Characters: {characters}")
except FileNotFoundError:
    print(f"The file '{filename}' does not exist.")
except Exception as e:
    print(f"An error occurred: {e}")
```

```
Enter the filename: source
Lines: 1
Words: 1
Characters: 6
PS C:\Users\surya.p\Desktop\PythonTask>
```
